

## Non-Compartmental Analysis (NCA)

- NCA is a popular analysis that produces standard PK parameters (e.g.  $C_{max}$ , AUC,  $t_{1/2}$ ) for regulatory submissions.
- NCA is a cost-effective tool allowing for a rapid readout of preclinical and early clinical data.
- The NCA outputs can be customized for rapid and efficient decision making. Tables, listings and figures can be tailored to the specific needs.
- Quality control (QC) of data and results is integrated in our process.
- We are delivering high quality, submission ready reports and CDISC compliant PK data.
- When performed within the Quantmetrics Validated Environment, the NCA can rapidly be extended to a pharmacometric model as part of a long term clinical pharmacology strategy.
